

STREAMTASK For Paragon® Upgrade Management

With the Right Tool, You Can Get the Most Out of Your Upgrades

StreamTask is the application designed to help manage McKesson Paragon® software releases.

StreamTask for Upgrade Management is web-based, platform-independent, and can help bring order to your software upgrade process. It enables information sharing, communication, and standardization that **spreadsheets can't provide.**

Organize Your Effort and Streamline Your Process with StreamTask

- Convert Release Notes into a database of tasks for testing
- Share an accessible database of testing information and results
- Stay informed through every stage of the update process with real-time status reports
- Enhance communication within your team, and with McKesson
- Increase the speed and quality of the testing process
- Track issues throughout their life cycle with detailed documentation
- Meet regulatory requirements with easily available testing documentation

StreamTask Transforms ICD-10 Test Plan Documentation into Tasks

You can use StreamTask to download and convert McKesson's **ICD-10 Test Plan for All Affected Applications** document into discrete online tasks, assign them to designated testers throughout the hospital, and track testing progress and results.

Organize Your Effort

Download your Release Notes from Download Central and use built-in conversion tools to import that information into **StreamTask's** SQL data base. Now in electronic format, it's easy to quickly share Work Items with end users, IT staff or both. You'll also be able to take advantage of mature task management capabilities that allow you to track, document, communicate and measure your progress.

Streamline the Process

Use **StreamTask's** powerful key word and other search capabilities to analyze the Release Notes, and utilize batching tools to find and separate the most significant enhancements from those of less importance, while also eliminating non-applicable tasks in seconds.

Project managers meanwhile can use Browse & Batch to re-assign and re-prioritize workload. Following your hospital's protocols, users document progress and log issues as they occur, thus providing the core team with current, real-time statuses. Users can track Pre-LIVE requirements via Customer Defined Queries and use scripts to facilitate testing procedures. Communication among users is managed within the system, while on-demand and rules-based e-mail messaging keep external staff informed.

About Array Software

Array Software has been helping hospitals manage their HIS updates for over 20 years. **StreamTask** enables hospitals to get the most out of their upgrades and ensure that all the enhancements are implemented.
